CoinWood

The cryptocurrency that plants trees

A Solana Token-2022 whose every transaction funds verified reforestation

Whitepaper v2.0 — July 2026

`$CWD : 2BUuvbNyarWgobMg9VqDKaubniHfF3Hs9KLR3vrXN2DX`

coinwood.org

1. Executive summary

CoinWood ($CWD) is a utility token on the Solana blockchain built around a single, verifiable mechanism: a 4% eco-fee on every transaction, enforced natively by Solana's official Token-2022 standard. The largest share of this fee buys real, certified trees through our partner Tree-Nation; the rest strengthens liquidity, funds growth and burns supply.

CoinWood's answer to the trust deficit of "green crypto" is radical simplicity: no custom smart contract, no yield promises, no black box. The fee, the fixed supply of 10 billion tokens and the fee cap are enforced by the same audited programs that secure the entire Solana ecosystem, and every euro of ecological impact is traceable from the on-chain treasury to a public tree-planting certificate.

This document describes the token mechanics, the tokenomics and its safeguards, the public presale that funds the launch, and the roadmap towards staking and community governance.

2. The problem

2.1 The reforestation funding gap

Restoring forest cover is one of the most cost-effective carbon-capture tools available, yet reforestation projects worldwide remain chronically under-funded and dependent on sporadic donations. Funding is the bottleneck — not land, not saplings, not local partners.

2.2 The trust deficit of green crypto

Dozens of "eco tokens" have promised impact and delivered little: unverifiable claims, opaque treasuries, custom contracts with hidden privileges, teams dumping on their communities. The result is legitimate skepticism towards any crypto project with an environmental narrative. A credible green token must make its impact independently verifiable and remove every technical means of betraying its holders.

3. The CoinWood solution

CoinWood converts trading activity into planted trees through a mechanism nobody — including the team — can bypass:

- **Enforced by the blockchain:** the 4% fee is a native Token-2022 *transfer fee*, executed by Solana's official token program on every transfer. It cannot be skipped, not even by the team.
- **Verified impact:** trees are purchased through Tree-Nation, which issues public, per-tree certificates in the CoinWood forest — impact you can click, not a slide in a deck.
- **Transparent treasury:** collected fees flow to a multisig treasury; weekly distributions (trees, liquidity, burn) are published and verifiable on-chain by anyone.
- **No custom code:** $CWD deliberately uses only standard, battle-tested Solana programs — there is nothing exotic to audit and no hidden owner privilege.

4. How the eco-fee works

Every transfer of $CWD automatically sets aside 4% (400 basis points), capped at 1,000,000 CWD per transfer. Withheld fees accumulate on token accounts and are harvested weekly to the treasury, then split as follows:

Share	Rate	Purpose
Reforestation fund	1.5%	Purchase of certified trees via Tree-Nation, with public certificates
Liquidity	1.0%	Reinforces the Raydium liquidity pool, reducing volatility
Marketing	1.0%	Listings, content and community growth
Buyback & burn	0.5%	Permanently removed from supply — deflationary pressure

The harvest-and-distribute cycle is executed from the treasury and published every week. Because the fee is collected in $CWD, distribution operations (tree purchases, liquidity additions, burns) are themselves visible as plain on-chain transactions.

The fee rate can be lowered (never above the initialized configuration) by the fee authority, which will be held by the community multisig — e.g. to accompany higher trading volumes. Any change is public and takes effect transparently on-chain.

5. The token

Property	Value
Name / symbol	CoinWood / $CWD
Blockchain	Solana (mainnet-beta)
Standard	Token-2022 (official SPL token extensions program)
Contract address	2BUuvbNyarWgobMg9VqDKaubniHfF3Hs9KLR3vrXN2DX
Total supply	10,000,000,000 CWD — **fixed forever** (mint authority revoked on-chain)
Decimals	6
Eco-fee	4% per transfer, capped at 1,000,000 CWD per transfer
Freeze authority	None — accounts can never be frozen
Metadata	On-chain, pointing to coinwood.org/token-metadata.json

The mint authority was revoked at deployment: no additional CWD can ever be created, by anyone. This is verifiable by opening the contract address in any Solana explorer ("Mint authority: not set").

A first version of $CWD was deployed in March 2025 on the classic SPL standard, which cannot carry an on-chain fee. It was never sold or listed, and is deprecated. Only the address above is official; it is published exclusively on coinwood.org and CoinWood's official channels.

6. Tokenomics

Category	Allocation	Purpose & safeguards
Presale	35%	Public sale on an established launchpad, with buyer vesting against day-one dumps
Liquidity (DEX)	20%	Raydium pool, locked for 12 months
Team & development	10%	Vested 12–24 months via a public vesting contract, locked before the presale
Reforestation fund	10%	Bootstrap of the planting program, before fee revenue takes over
Staking & rewards	10%	Rewards for long-term holders once staking opens
Marketing	10%	Listings (CoinGecko / CoinMarketCap), content, campaigns
Airdrops & community	5%	Early adopters and community campaigns

Safeguards are part of the design: team tokens are locked in a public vesting contract before the presale opens; presale liquidity is locked for 12 months; the supply and every token authority already sit in a dedicated Squads multisig treasury, whose signer set and threshold will be expanded before the presale opens.

7. Public presale & use of funds

The launch is funded by a public presale on an established launchpad (Pinksale), with a soft cap of €15,000 and a hard cap of €250,000 (denominated in SOL at sale time). CoinWood does not need millions to plant its first trees — it needs liquidity, a locked foundation and a motivated community. If traction warrants it, a complementary round may follow, always within the regulatory limits described below.

Use	Share	Detail
Liquidity (locked)	≥ 51%	Automatically added to the Raydium pool and locked for 12 months
Marketing & listings	20%	Launch campaign, listings, content
First plantings	15%	Immediate, visible tree purchases via Tree-Nation
Legal & operations	14%	MiCA-compliant review, tooling, operational costs

Presale buyers receive their tokens with a vesting schedule (a portion unlocked at listing, the remainder linearly over the following months) — protecting the launch price and aligning early buyers with the project's horizon.

The offer is designed to remain within the MiCA exemption for public offers of crypto-assets below €1,000,000 over 12 months (Regulation (EU) 2023/1114, art. 4). This document is informational and does not constitute a MiCA white paper, a prospectus, or investment advice.

8. Roadmap

Phase	Target	Milestones
Relaunch	Q3 2026	Token-2022 contract live (done) — new website and whitepaper (done)
Community & mission funding	H2 2026	Community built in the open — donation campaigns for the mission (Giveth, Gitcoin, Miimosa) — creation of the “Forêt CoinWood” association
Presale & listing	2027	Public presale with buyer vesting — team tokens locked beforehand — Raydium listing, liquidity locked 12 months — first trees funded by the eco-fee
Growth & governance	2027+	Staking — monthly public planting reports — CoinGecko / CoinMarketCap — incorporation of a legal entity; complementary impact fundraising (equity crowdfunding) under consideration — community DAO — GreenPass NFT

9. Staking & governance outlook

After listing, holders will be able to stake $CWD through an established, audited staking service to earn rewards from the dedicated 10% allocation. Reward rates will be tied to the project's ecological milestones — growing the forest and holding long-term reinforce each other.

In a second phase, a community DAO will steer the reforestation fund: choice of planting projects, distribution cadence, partnerships. The GreenPass NFT collection will recognise long-term supporters with staking boosts and governance weight.

10. Transparency commitments

- Only standard Solana programs — no custom contract, no owner privileges, nothing to hide.
- Fixed supply, verifiable on-chain by anyone, forever.
- Multisig treasury; weekly harvest and distribution published on official channels.
- Public, per-tree certificates on the CoinWood forest page at Tree-Nation.
- Team tokens locked in public vesting before any public sale.
- One official contract address, published only on coinwood.org and official channels.

11. Legal notice & risk warnings

$CWD is a utility token supporting a reforestation ecosystem. It confers no equity, debt, dividend, or claim on any entity, and no promise of profit. Nothing in this document constitutes financial, investment, legal or tax advice.

Crypto-assets are highly volatile. The value of $CWD can go to zero. Transfer fees reduce the amount received on every transfer. Regulatory treatment of crypto-assets may change. Never commit funds you cannot afford to lose, and do your own research.

The offer is structured to fall within the exemption of article 4 of Regulation (EU) 2023/1114 (MiCA) for offers below €1,000,000 over 12 months. Purchasers remain responsible for compliance with the laws of their own jurisdiction; the presale is not directed at persons in jurisdictions where it would be unlawful.
